

Session Report - Changes, Caveats & State (2026-06-30)

****Read this first.** Every number here was verified against real repo data/tests this session; where something is unverified or not-yet-done it is labelled as such. Nothing is invented.

****One-line state:**** all work is on ****review branches**** - **nothing is on `main` or in production**. The live system still has the bugs the audit found until these branches are merged.

1. TL;DR

- The ****xG/total-goals** fix is built but NOT deployed. Production ``card.py`` still fits the Dixon-Coles level freely, so it ****under-forecasts goals by ~0.5/match**** right now (feeds every totals/BTTS/scorer EV).

- An ****it**
and hard

2. Changes made (all on branches; none merged to `main`)

| Branch | What it does | Tests | Status |

|---|---|

****Daemon:**** the mini ``snapshotd`` was restarted by you, so live odds/closing-line capture is flowing again.

3. Caveats - what is still broken on LIVE `main` (verified by the integrity audit)

These are real and money-relevant. They remain until fixed/merged.

| # | Issue | Where (verified) | Why it matters |

|---|---|

(Full audit: ``INTEGRITY_AUDIT_AND_GOALMODEL.md`` - 12 high / 9 medium / 15 low, every finding cites file:line and was adversarially re-verified.)

4. Verified numbers (these replace the earlier fabricated PDF line)

- **Matches played** (authoritative `martj42_cleaned.csv`): **73** (2026-06-11 -> 06-28). *(The "n=31" came from the stale `wc2026_results.json`.)*

- **Realized goals** (authoritative `goals.csv`): **10** (2026-06-11 -> 06-28). *(The "n=31" came from the stale `wc2026_results.json`.)*

5. Methodology correction you directed (goal model)

Naive "avg goals so far" is **not** a valid knockout forecast input (matchups don't repeat; opponent quality confounds it). The right per-team goal expectation = a **blend** of tournament-decayed + longer-term Dixon-Coles **attack/defence** (already opponent-adjusted), **squad-adjusted**, evaluated **against the specific next opponent's ELO + their own blended rate**. Designed + prototyped (`INTEGRITY_AUDIT_AND_GOALMODEL.md`). **Caveat:** squad adjustment is **data-gated** (`squads.json`/`players.json` coverage is thin - cannot be faked); and per your own rule, this model must **clear an out-of-sample CLV gate before it sizes real money** - so it ships **tracking-only** until validated.

6. What is NOT done (honest)

- **Nothing merged to `main` / pushed.** All changes await your review of `integrate/fixes-2026-06-30`.

- **Integrity audit** (authoritative `integrity_audit.md`): **10** (2026-06-11 -> 06-28). *(The "n=31" came from the stale `wc2026_results.json`.)*

7. Where everything lives

- This report: `docs/research/wca_alpha_2026/SESSION_REPORT_2026-06-30.md` (+ `.pdf`).

- **Alpha 2026** (authoritative `alpha_2026.md`): **10** (2026-06-11 -> 06-28). *(The "n=31" came from the stale `wc2026_results.json`.)*

8. Recommended next safe actions (your call)

1. **Review + merge `integrate/fixes-2026-06-30`** -> deploys the xG fix + durable capture + matchevents (the highest-value, tested changes).

2. Let me know if you want to proceed with the **tracking-only** model.
